

Pager system for Automobile sector

Recently we had supplied our Syscall Pager system to an Automobile parts manufacturing company near Chennai. This company manufactures springs for passenger cars.

The process involves workers doing a specific job, packs the items in a crate and as soon as the crate is full, they have to call for the fork-lift operator. The fork-lift operator goes to the place of the specific worker and scoops up the crate to deliver it to the nearby godown.

The environment being a noisy one with a lot of machinery working and clanging, it was almost impossible for the workers to call the fork-lift operator.

SYSCALL SOLUTION: Each worker was provided with a buzzer and as soon as the chore is over and when it is time to beckon the fork-lift operator, he presses the buzzer.

The fork-lift operator is provided with a watch-like device and as soon as the worker buzzes, he gets the message. There are 12 workers in this division and each of them is provided with a buzzer. The fork-lift operator's watch-like device also let him know as to the number of the worker from whom the call had come and he goes there to scoop up the crates.

The SYSCALL has thus given this company the ideal solution to work in such challenging environments.
